🔗 Share

Given a list of non negative integers, arrange them such that they form the largest number.

Example 1:

Input: [10, 2]**Output:** "210"

Example 2:

Input: [3, 30, 34, 5, 9]**Output:** "9534330"

Note: The result may be very large, so you need to return a string instead of an integer.
